Abstract The purpose of this study was to determine the effect of a 12-week training program on the heart rate variability (HRV) of young adults. The study was conducted in a laboratory setting. The participants were 20 young adults (10 males and 10 females) who were randomly assigned to two groups: a control group and an experimental group. The control group did not receive any training, while the experimental group received a 12-week training program. The HRV was measured at the beginning and at the end of the 12-week period. The results showed that the experimental group had a significant increase in HRV compared to the control group. This suggests that the 12-week training program had a positive effect on the HRV of young adults.

Abstract The purpose of this study was to determine the effect of a 12-week resistance training program on the muscle strength and endurance of the lower extremities in healthy young adults. The subjects were 15 male and 15 female college students, aged 18 to 25 years, who had no previous experience with resistance training. They were randomly assigned to either a resistance training group or a control group. The resistance training group performed a 12-week program of resistance training, while the control group did not. The subjects were tested at baseline and at 12 weeks for muscle strength and endurance. The results showed that the resistance training group had significantly greater increases in muscle strength and endurance than the control group. The findings suggest that a 12-week resistance training program can effectively improve muscle strength and endurance in healthy young adults.

五、检测结论

经检测，该固体废物中钡、铜、铁、铬的含量分别为 0.004mg/L、70.6mg/L、6.62mg/L、0.02mg/L。检测结果符合《危险废物鉴别标准 浸出毒性鉴别》(GB 16885-2008)中表 1 的要求。

检测结论: 该固体废物中钡、铜、铁、铬的含量符合《危险废物鉴别标准 浸出毒性鉴别》(GB 16885-2008)中表 1 的要求。

汞	≤ 10 ⁻⁵	0.05	mg/L
