The chemical structure shows a repeating unit of a poly(2,5-bis(4-phenyl)-1,4-dithienyl) derivative. It consists of a central thiophene ring connected at the 2 and 5 positions to two 4-phenylthiophene groups. The phenyl rings are represented by hexagons with a circle inside, and the thiophene rings are represented by pentagons with a circle inside. The structure is shown as a repeating unit with a subscript 'n'.

Chemical structure of compound 10, a complex polycyclic molecule with multiple functional groups including hydroxyl, carbonyl, and amine groups.

The diagram shows a 2D hexagonal lattice of atoms, represented by solid circles. A central atom is highlighted with a larger radius. A dashed line connects this central atom to one of its nearest neighbors. The lattice is labeled with 'a' for the lattice constant and 'r' for the distance between adjacent atoms.

Figure 1 is a line graph showing the percentage of the total population in the labor force by age group for the years 1980, 1990, and 2000. The Y-axis represents the percentage of the total population in the labor force, ranging from 0 to 100. The X-axis represents the years. The age groups are 15-24, 25-34, 35-44, 45-54, 55-64, 65-74, and 75+.

Figure 1 illustrates the experimental setup. A subject is seated at a table, viewing a video screen. A camera is positioned above the screen to record the subject's hand position. A light source is positioned to the left of the screen to illuminate the target. The target is a small object on the screen. The subject is looking at the target through the video screen. The camera is recording the subject's hand position. The light source is illuminating the target. The target is a small object on the screen. The subject is a person sitting at the table. The video screen is a monitor. The camera is a video camera. The light source is a lamp. The target is a small object.

the β phase of the polymer. The β phase is the more ordered phase and is characterized by a higher density than the α phase. The β phase is also the more stable phase and is the one that is observed in the crystalline state of the polymer. The β phase is the one that is observed in the crystalline state of the polymer.

Figure 1 is a schematic diagram of the experimental setup. It shows a subject seated at a table, looking at a screen. The screen displays a target (a red dot) and a starting point (a green dot). The subject's hand is positioned at the starting point. The screen is labeled with 'W. 15°' and 'W. 30°'. The subject's hand is labeled 'H. 15°' and 'H. 30°'. The screen is labeled 'Screen' and 'Target'.

Figure 1. Schematic representation of the *hsp70* gene structure. The gene is composed of 10 exons (numbered 1 to 10) and 9 introns (numbered 1 to 9). The exons are represented by boxes, and the introns by lines. The exons are numbered 1 to 10, and the introns are numbered 1 to 9. The exons are numbered 1 to 10, and the introns are numbered 1 to 9. The exons are numbered 1 to 10, and the introns are numbered 1 to 9.
